

## Portadown Community Treatment & Care Centre

Although the updated Part F regulations were introduced in 2006, for the design team at the new Portadown CTCC this was the first project that needed to meet the new targets for CO<sub>2</sub> emissions and air tightness. Stroma was appointed to provide not only accredited testing and consultancy, but contracting services as well. A team of trained installers worked for a total period of 6 weeks installing fire stopping and acoustic barriers and enhancing the work of other subcontract packages to ensure that the building was airtight. Though not a mandatory requirement, a series of acoustic tests were carried out to demonstrate the robust nature of the completed works.
